

CSE 421/521 - Operating Systems  
Fall 2014 Recitations

RECITATION - II  
**UNIX PROCESSES**  
PROF. TEVFIK KOSAR

Presented by Luigi Di Tacchio

University at Buffalo  
September 2014

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()
  - ▶ creation of processes
  - ▶ shell and its implementation
  - ▶ environment variables
  - ▶ process control
  - ▶ pipes

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ **fork() vs exec()**
  - ▶ creation of processes
  - ▶ shell and its implementation
  - ▶ environment variables
  - ▶ process control
  - ▶ pipes

# fork()

Exec()

exec()

The process image is  
**REPLACED**  
by another image

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()
  - ▶ **creation of processes**
  - ▶ shell and its implementation
  - ▶ environment variables
  - ▶ process control
  - ▶ pipes

# Process creation: fork() and exec()

- fork() and exec() can be used **together** to create new processes and launch programs

# Process Creation: code structure

```
...
int main(...)
{
    ...
    if ((pid = fork()) == 0)                // create a process
    {
        fprintf(stdout, "Child pid: %i\n", getpid());
        err = execvp(command, arguments);    // execute child
                                              // process
        fprintf(stderr, "Child error: %i\n", errno);
        exit(err);
    }
    else if (pid > 0)                        // we are in the
    {                                        // parent process
        fprintf(stdout, "Parent pid: %i\n", getpid());
        pid2 = waitpid(pid, &status, 0);      // wait for child
        ...                                  // process
    }
    ...

    return 0;
}
```

# Exec Family

```
int exec1(const char *path, const char *arg, ...);
```

```
int exec1p(const char *file, const char *arg, ...);
```

```
int execle(const char *path, const char *arg , ...,  
           char * const envp[]);
```

```
int execv(const char *path, char *const argv[]);
```

```
int execvp(const char *file, char *const argv[]);
```

## When calling any exec\*

- Kernel loads program from disk into the process
- Kernel copies arglist into the process
- Kernel calls `main(argc,argv)`

## Example: running “ls -l”

```
#include <unistd.h>
#include <stdio.h>

main()
{
    char    *arglist[3];

    arglist[0] = "ls";
    arglist[1] = "-l";
    arglist[2] = 0 ;

    printf("* * * About to exec ls -l\n");
    execvp( "ls" , arglist );
    printf("* * * ls is done. bye\n");
}
```

# REMEMBER

execvp is like a Brain Transplant!

- execvp loads the new program into the current process, replacing the code and data of that process!

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()
  - ▶ creation of processes
  - ▶ **shell and its implementation**
  - ▶ environment variables
  - ▶ process control
  - ▶ pipes

# Shell

- A tool for process and program control
- Three main functions
  - Shells run programs
  - Shells manage I/O
  - Shells can be programmed (**shell scripts**)
- Main Loop of a Shell

```
while (!end_of_input){  
    get command  
    execute command  
    wait for command to finish (unless you launched  
                                the program in background with &)  
}
```

# Writing a Shell v1.0

```
int main()
{
    char *arglist[MAXARGS+1];    /* an array of ptrs */
    int  numargs;                 /* index into array */
    char argbuf[ARGLEN];          /* read stuff here */
    char *makestring();           /* malloc etc */

    numargs = 0;
    while ( numargs < MAXARGS )
    {
        printf("Arg[%d]? ", numargs);
        if ( fgets(argbuf, ARGLEN, stdin) && *argbuf != '\n' )
            arglist[numargs++] = makestring(argbuf);
        else
        {
            if ( numargs > 0 ){      /* any args? */
                arglist[numargs]=NULL; /* close list */
                execute( arglist ); /* do it */
                numargs = 0;          /* and reset */
            }
        }
    }
    return 0;
}
```

```
#include <stdio.h>
#include <signal.h>
#include <string.h>

#define MAXARGS 20
#define ARGLEN 100
```

# Writing a Shell v1.0 (cont.)

```
int execute( char *arglist[] )
{
    execvp(arglist[0], arglist);           /* do it */
    perror("execvp failed");
    exit(1);
}

char * makestring( char *buf )
{
    char *cp, *malloc();

    buf[strlen(buf)-1] = '\\0';             /* trim newline */
    cp = malloc( strlen(buf)+1 );          /* get memory */
    if ( cp == NULL ){                     /* or die */
        fprintf(stderr, "no memory\\n");
        exit(1);
    }
    strcpy(cp, buf);                       /* copy chars */
    return cp;                             /* return ptr */
}
```

# Writing a Shell v2.0

```
execute( char *arglist[] )
{
    int pid,exitstatus;                /* of child */

    pid = fork();                      /* make new process */
    switch( pid ){
        case -1:
            perror("fork failed");
            exit(1);
        case 0:
            execvp(arglist[0], arglist);    /* do it */
            perror("execvp failed");
            exit(1);
        default:
            while( wait(&exitstatus) != pid )
                ;
            printf("child exited with status %d,%d\n",
                    exitstatus>>8, exitstatus&0377);
    }
}
```

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()

  - ▶ shell and its implementation
  - ▶ **environment variables**
  - ▶ process control
  - ▶ pipes

# Environment Variables

```
$ env
HOSTNAME=classes
TERM=xterm-color
USER=cs4304_kos
HOSTTYPE=x86_64
PATH=/usr/local/bin:/usr/bin:/opt/gnome/bin:/usr/lib/mit/
sbin:./
CPU=x86_64
PWD=/classes/cs4304/cs4304_kos
LANG=en_US.UTF-8
SHELL=/bin/bash
HOME=/classes/cs4304/cs4304_kos
MACHTYPE=x86_64-suse-linux
LOGNAME=cs4304_kos
...
```

# Updating the Environment

For **sh**, **ksh** or **bash**:

(use **echo \$SHELL** to check which shell)

```
$ course=csc4304
```

```
$ export course
```

```
$ env | grep course
```

```
course=csc4304
```

or

```
$export course="systems programming"
```

```
$ env | grep course
```

```
course=systems programming
```

# Updating the Environment

For **cs**h or **tc**sh:

(use **echo \$SHELL** to check which shell)

```
$ setenv course=cse421
```

```
$ env | grep course
```

```
course=cse421
```

# How is Environment Implemented?

## ■ Environment Variables

- `int main(int argc, char **argv, char **envp);`

`extern char **environ;`

environment  
list

environment  
strings

HOME=/home/stevens\0

PATH=:/bin:/usr/bin\0

SHELL=/bin/sh\0

USER=stevens\0

LOGNAME=stevens\0

## ■ `getenv/putenv`

## Example 1: external variable

```
#include <stdio.h>
#include <malloc.h>

extern char **environ;

main()
{
    char ** ptr;

    for (ptr=environ; *ptr != 0; ptr++)
        printf("%s\n", *ptr);
}
```

## Example 2: main input array

```
#include <stdio.h>
#include <malloc.h>

main(int argc, char *argv[], char *env[])
{
    char ** ptr;

    for (ptr=env; *ptr != 0; ptr++)
        printf("%s\n", *ptr);
}
```

## Example 3: getenv

```
char * getenv(const char *name);
```

```
#include <stdio.h>
#include <stdlib.h>

main()
{
    printf("SHELL = %s\n", getenv("SHELL"));
    printf("HOST = %s\n", getenv("HOST"));
}
```

## Example 3: putenv and setenv

```
int putenv(const char *name); //name=value
int setenv(const char *name, const char *value, int rw);

void unsetenv(const char *name);
```

```
#include <stdio.h>#include <stdlib.h>main()
{  setenv("HOST", "new host name", 1);
    printf("HOST = %s\n", getenv("HOST"));
    printf("HOST = %s\n", getenv("HOST"));}
```

# Shell commands from program: system function

```
int system(const char *command);
```

- used to execute command strings
- e.g. `system("date > file");`
- implemented using `fork()`, `exec()`, and `waitpid()`

## Example 4: system("env")

```
#include <stdio.h>
#include <unistd.h>
extern char **environ;

main()
{
    char    *newenv[5];
    printf("The current environment is..\n");
    system("env");

    printf("***** Now Replacing Environment...\n"); getchar();
    newenv[0] = "HOME=/on/the/range";
    newenv[1] = "LOGNAME=nobody";
    newenv[2] = "PATH=./bin:/usr/bin";
    newenv[3] = "DAY=Wednesday";
    newenv[4] = 0 ;
    environ = newenv;
    execlp("env", "env", NULL);
}
```

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()
  - ▶ creation of processes
  - ▶ shell and its implementation
  - ▶ environment variables
  - ▶ **process control**
  - ▶ pipes

# vfork function

```
pid_t vfork(void);
```

- Similar to fork, but:
  - child shares all memory with parent
  - parent is suspended until the child makes an **exit** or **exec** call

# fork example

```
main()
{
    int    ret, glob=10;

    printf("glob before fork: %d\n", glob);
    ret = fork();

    if (ret == 0) {
        glob++;
        printf("child: glob after fork: %d\n", glob) ;
        exit(0);
    }

    if (ret > 0) {

        if (waitpid(ret, NULL, 0) != ret) printf("Wait error!\n");
        printf("parent: glob after fork: %d\n", glob) ;
    }

}
```

# vfork example

```
main()
{
    int    ret, glob=10;

    printf("glob before fork: %d\n", glob);
    ret = vfork();

    if (ret == 0) {
        glob++;
        printf("child: glob after fork: %d\n", glob) ;
        exit(0);
    }

    if (ret > 0) {

        //if (waitpid(ret, NULL, 0) != ret) printf("Wait error!\n");
        printf("parent: glob after fork: %d\n", glob) ;
    }

}
```

# Race Conditions

```
static void charatotime(char *str)
{
    char *ptr;
    int c;

    setbuf(stdout, NULL);
    for (ptr=str;c=*ptr++;) putc(c,stdout);
}

main()
{
    pid_t pid;

    if ((pid = fork())<0) printf("fork error!\n");
    else if (pid ==0) charatotime("12345678901234567890\n");
    else charatotime("abcdefghijklmnopqrstuvwxyz\n");
}
```

# Output

```
$ fork3  
12345678901234567890  
abcdefghijklmnopqrstuvwxyz
```

```
$ fork3  
12a3bc4d5e6f78901g23hi4567jk890  
lmnopqrstuvwxyz
```

# Avoid Race Conditions

```
static void charatotime(char *str)
{
    char *ptr;
    int c;

    setbuf(stdout, NULL);
    for (ptr=str; c=*ptr++;) putc(c, stdout);
}

main()
{
    pid_t pid;
    TELL_WAIT();

    if ((pid = fork())<0) printf("fork error!\n");
    else if (pid ==0) {WAIT_PARENT(); charatotime("12345678901234567890\n");}
    else {charatotime("abcdefghijklmnopqrstuvwxyz\n"); TELL_CHILD();}
}
```

# Process Accounting

- Kernel writes an accounting record each time a process terminates
- **acct struct** defined in <sys/acct.h>

```
typedef u_short comp_t;
struct acct {
    char    ac_flag; /* Figure 8.9 — Page 227 */
    char    ac_stat; /* termination status (core flag + signal #) */
    uid_t   ac_uid; gid_t   ac_gid; /* real [ug]id */
    dev_t   ac_tty; /* controlling terminal */
    time_t  ac_btime; /* starting calendar time (seconds) */
    comp_t  ac_utime; /* user CPU time (ticks) */
    comp_t  ac_stime; /* system CPU time (ticks) */
    comp_t  ac_etime; /* elapsed time (ticks) */
    comp_t  ac_mem; /* average memory usage */
    comp_t  ac_io; /* bytes transferred (by r/w) */
    comp_t  ac_rw; /* blocks read or written */
    char    ac_comm[8]; /* command name: [8] for SVR4, [10] for
4.3 BSD */
};
```

# Process Accounting

- Data required for accounting record is kept in the process table
- Initialized when a new process is created
  - (e.g. after fork)
- Written into the accounting file (binary) when the process terminates
  - in the order of termination
- No records for
  - crashed processes
  - abnormal terminated processes

# In Today's Class

- Unix Process Environment
  - ▶ ps : get process info
  - ▶ fork() vs exec()
  - ▶ creation of processes
  - ▶ shell and its implementation
  - ▶ environment variables
  - ▶ process control
  - ▶ **pipes**

# Pipes

- one-way data channel in the kernel
- has a reading end and a writing end

# Process Communication via Pipes

```
int pipe(int filedes[2]);
```

- pipe creates a pair of file descriptors, pointing to a pipe inode, and places them in the array pointed to by filedes. filedes[0] is for reading filedes[1] is for writing

```

main(int ac, char *av[])
{
    int      thepipe[2], newfd, pid;*/
    if ( ac != 3 ){fprintf(stderr, "usage: pipe cmd1 cmd2\n");exit(1);}

    if (pipe(thepipe) == -1){perror( "cannot create pipe"); exit(1); }

    if ((pid = fork()) == -1){fprintf(stderr,"cannot fork\n"); exit(1);}

    /*
    *      parent will read from reading end of pipe
    */

    if ( pid > 0 ){
        /* the child will be av[2]      */
        close(thepipe[1]);      /* close writing end      */
        close(0);      /* will read from pipe      */
        newfd=dup(thepipe[0]); /* so duplicate the reading end */
        if ( newfd != 0 ){      /* if not the new stdin..      */
            fprintf(stderr,"Dupe failed on reading end\n");
            exit(1);
        }
        close(thepipe[0]);      /* stdin is duped, close pipe      */
