September 11th, 2014

Pintos Projects

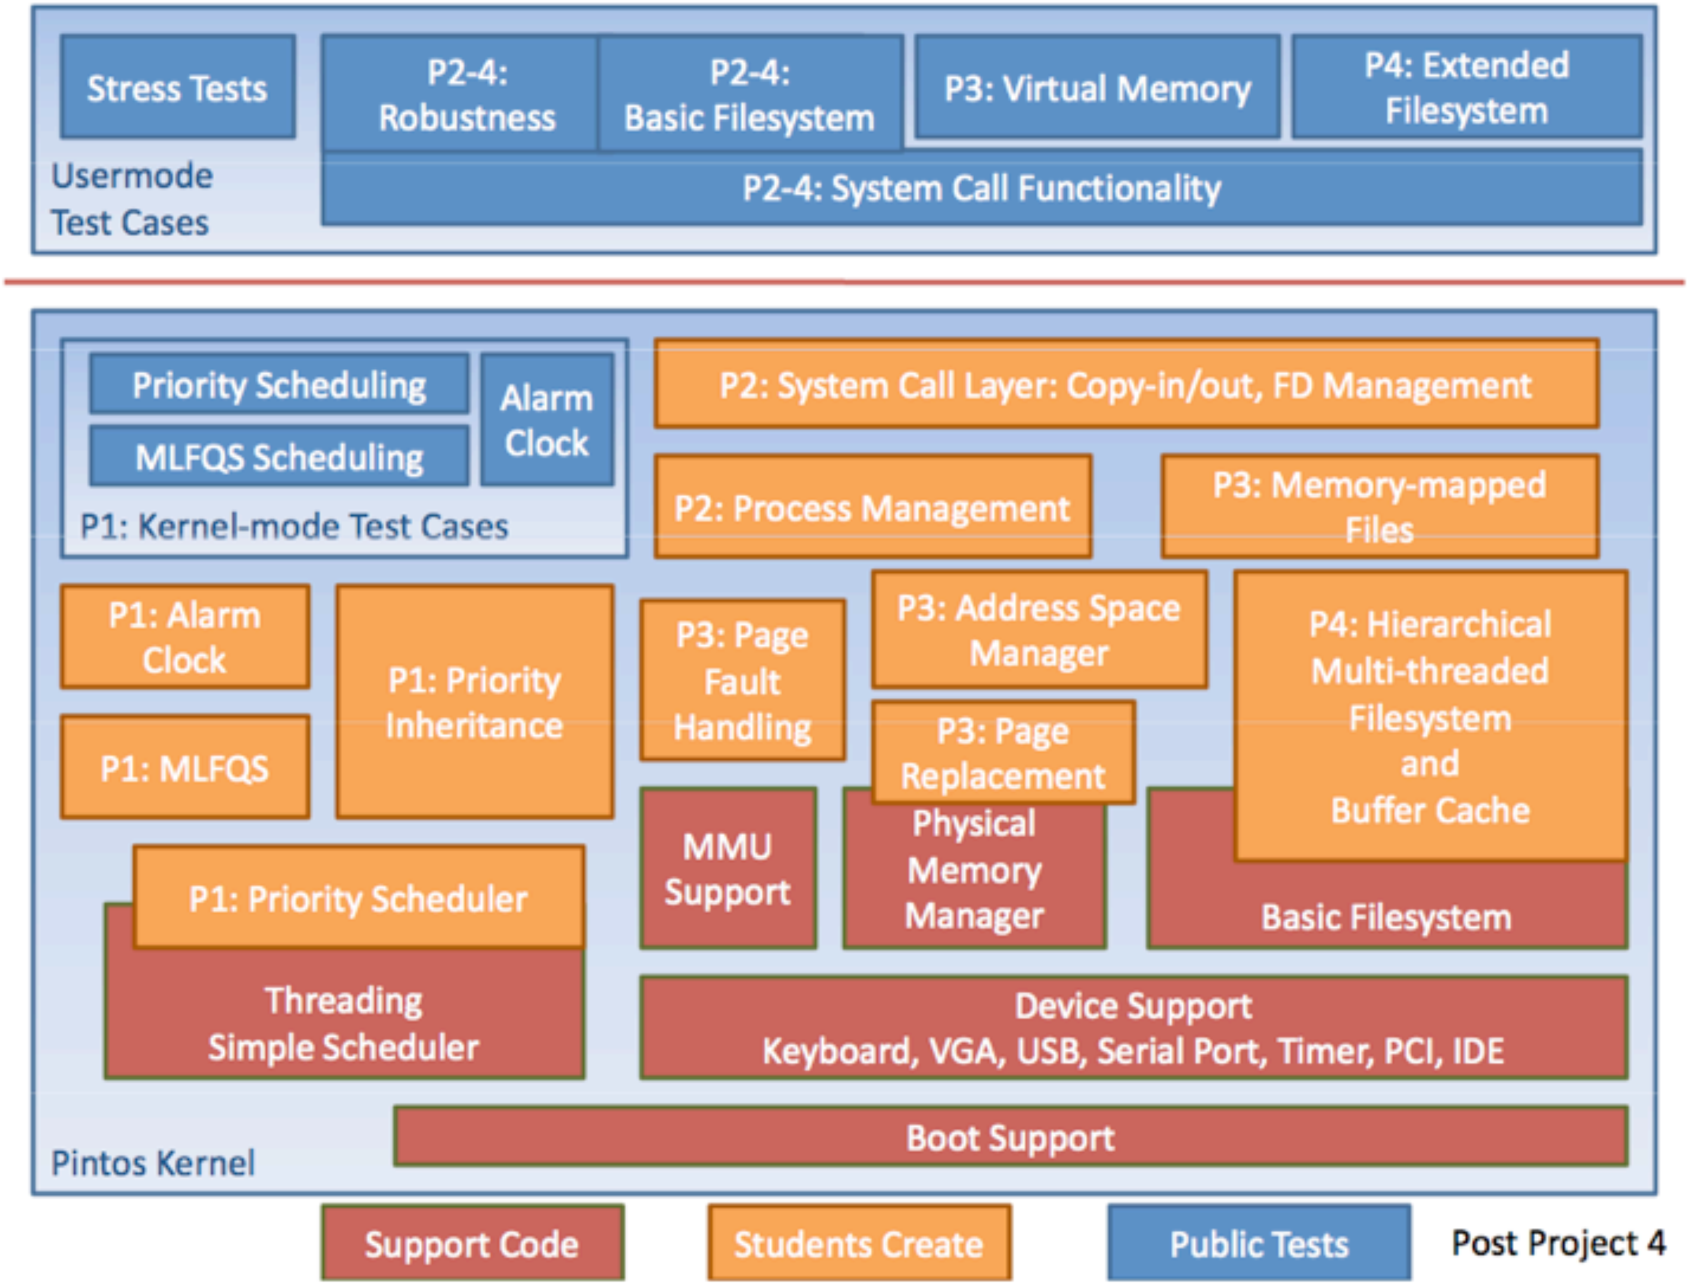
1. Threads <-- CSE 421/521 Project 1

2. User Programs

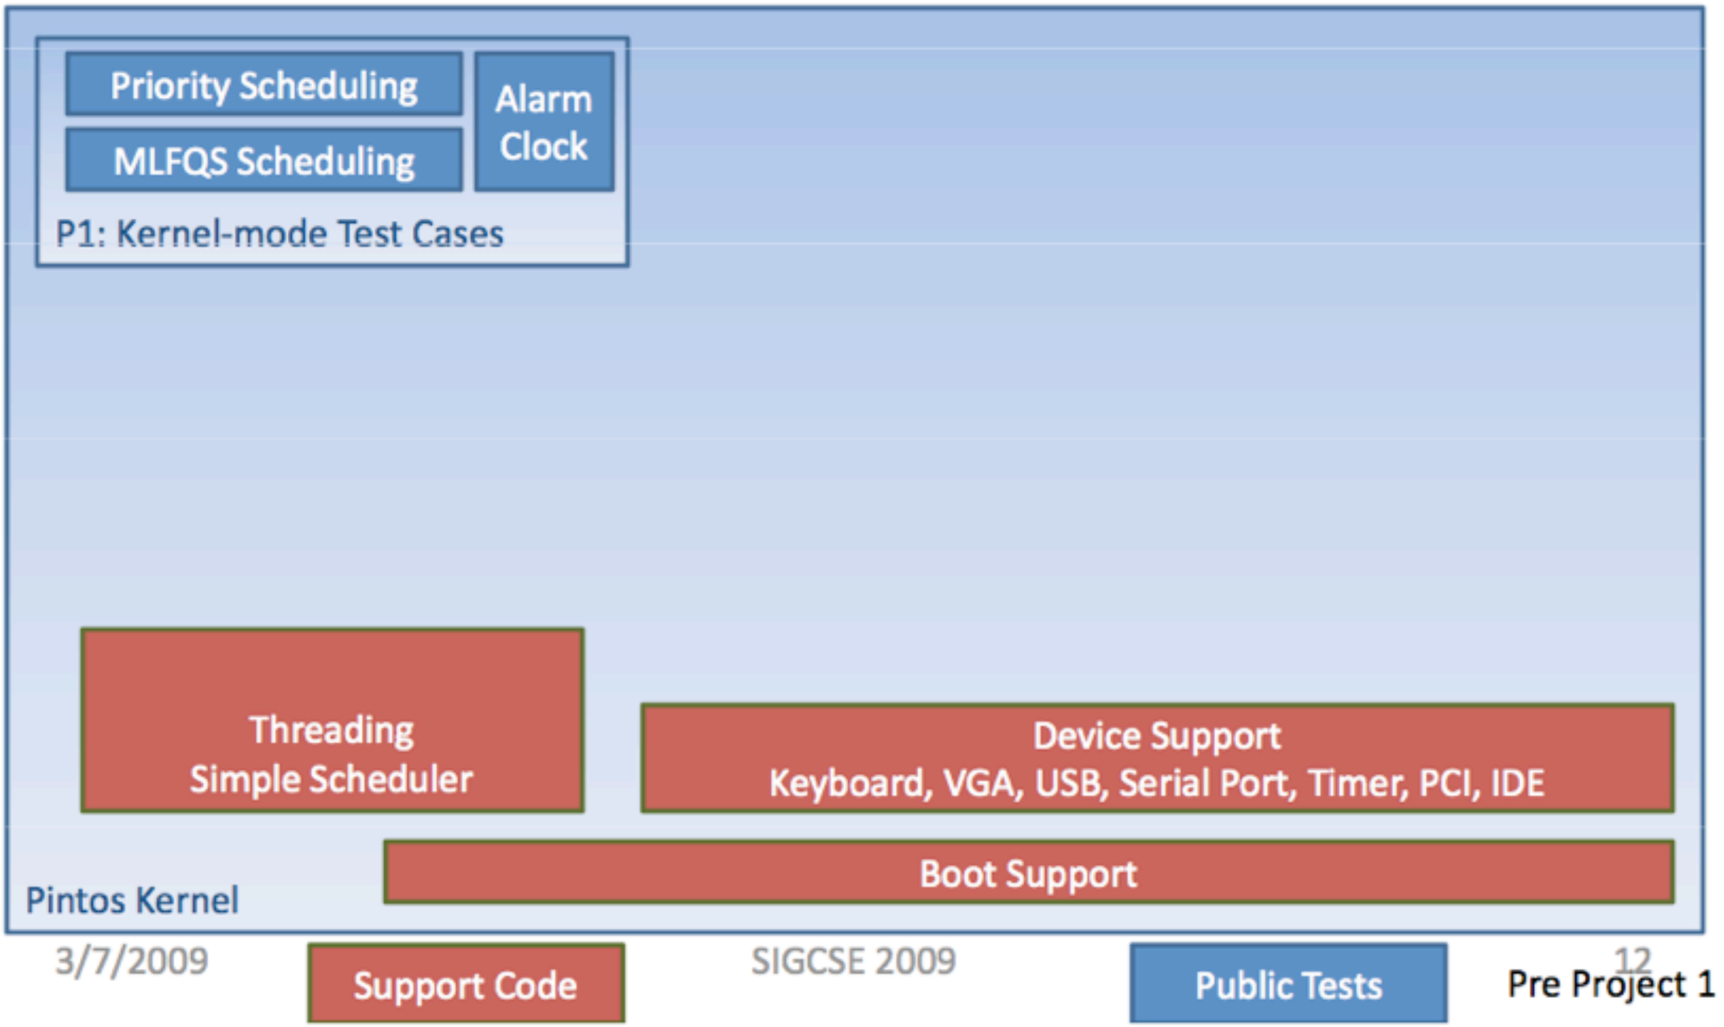
3. Virtual Memory

4. File Systems

Pintos after full implementation (post prj-4)

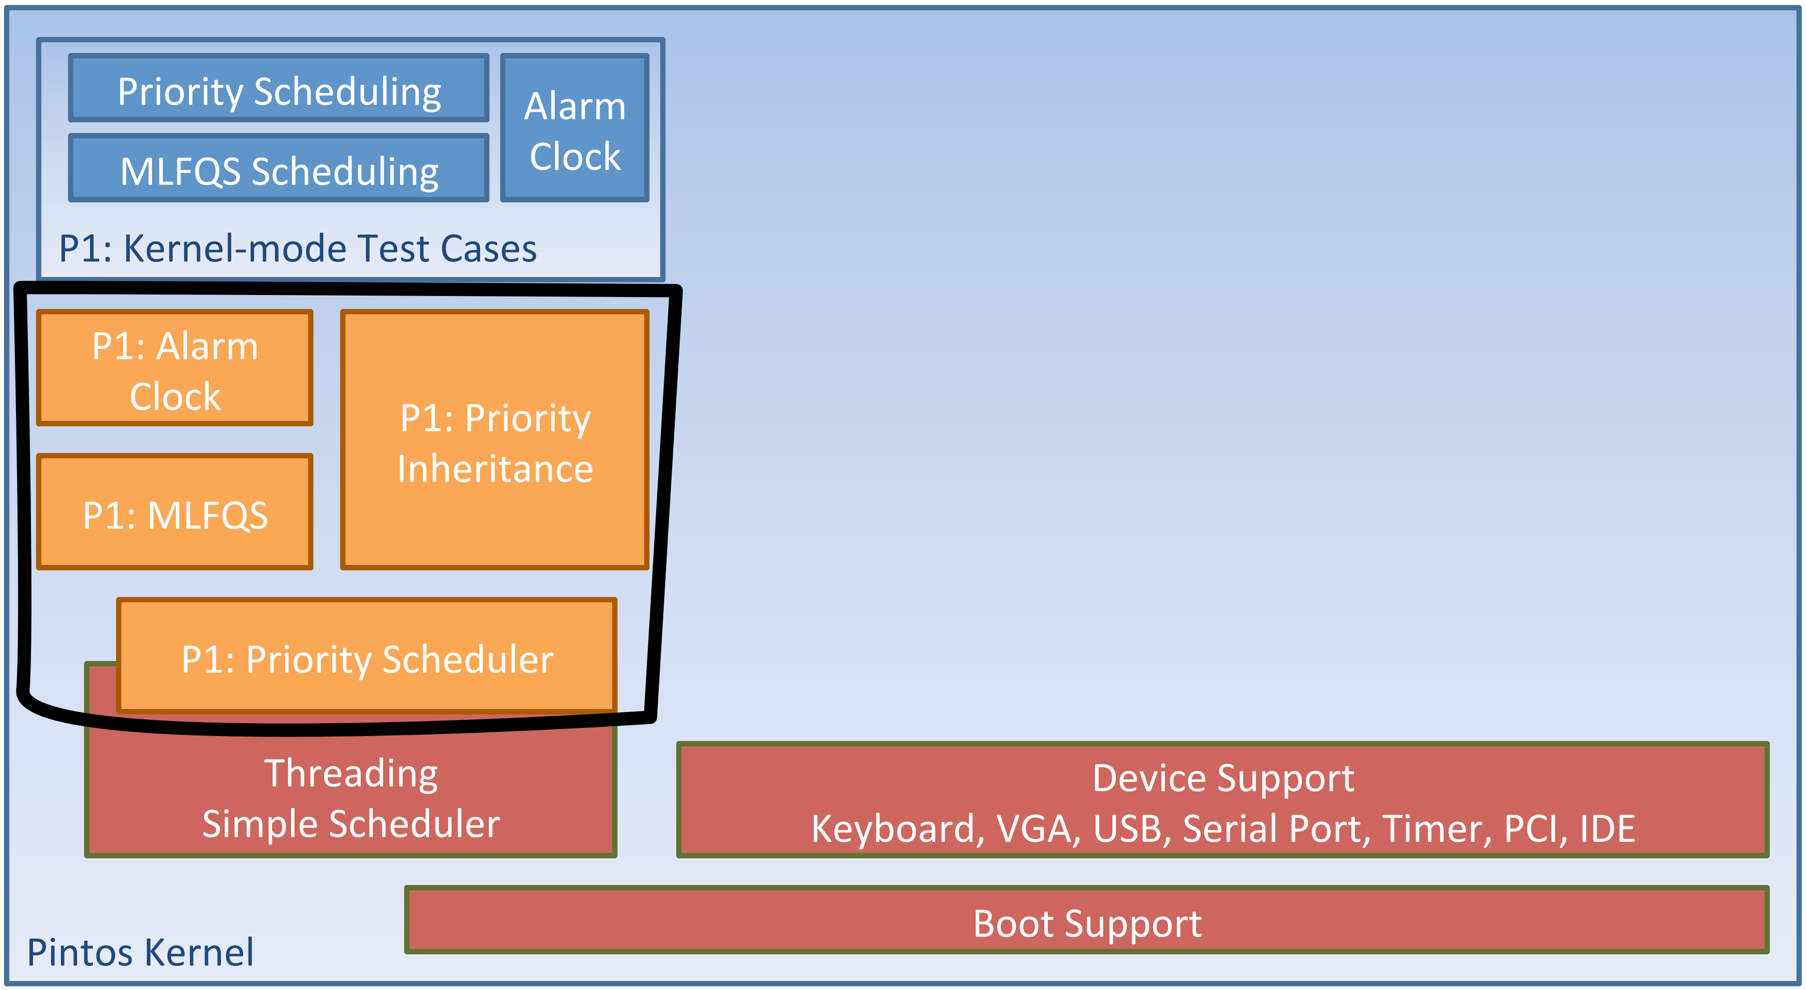


Yo will be provided with this (pre prj-1)



Pre Project 1

You will implement this (post prj-1)



Step 1: Preparation

READ:

- Chapters 3-5 from Silberschatz
- Lecture slides on Processes, Threads and CPU Scheduling
- From Pintos Documentation:
  - Section 1 - Introduction
  - Section 2 - Threads
  - Appendix A1- Pintos Loading
  - Appendix A2 - Threads
  - Appendix A3 - Synchronization
  - Appendix B - 4.4BSD Scheduler

Step 2: Setting Up Pintos

- Option 1: Fetch source code from:
  /web/faculty/tkosar/cse421-521/projects/project-1/pintos.tar
  then follow the setup guidelines we have provided on Piazza
  ==> tested on dragonforce, styx, nickelback

- Option 2: Use the Pintos VM we have prepared for you:
  http://ftp.cse.buffalo.edu/CSE421/Pintos.ova
  requires Virtualbox software
  ==> will work on most Linux, Windows, Mac systems

- Option 3: Grab the source directly from pintos git repository:
  http://pintos-os.org/cgi-bin/gitweb.cgi
  you would also need Bochs or Qemu simulator wit this option

Step 3: Implementation

1. Alarm Clock

2. Priority Scheduler (with priority donation)

3. Multilevel Feedback Queue Scheduler

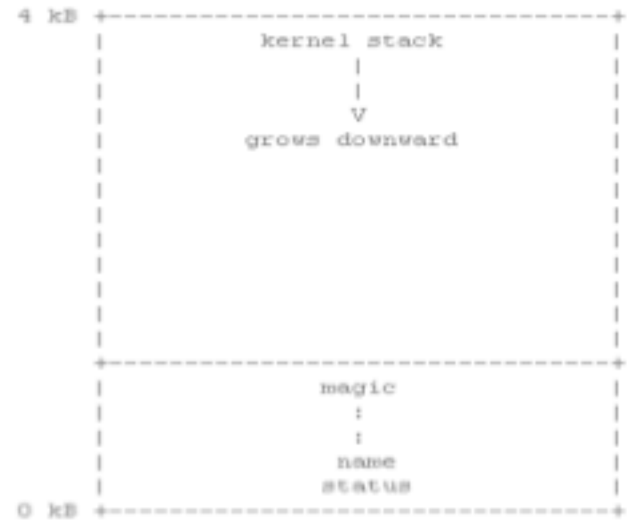
Pintos Thread System

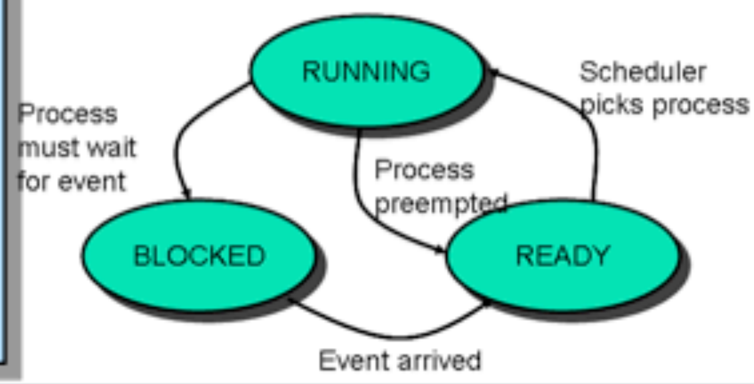
Defined in threads/thread.h:

```
struct thread
  {
    tid_t tid;           /* Thread identifier. */
    enum thread_status status;          /* Thread state. */
    char name[16];   /* Name (for debugging purposes). */
    uint8_t *stack;    /* Saved stack pointer. */
    int priority;         /* Priority. */
    struct list_elem allelem;  /* List element for all-threads list.*/
    /* Shared between thread.c and synch.c. */
    struct list_elem elem;              /* List element. */

You add more fields here as you need them.

#ifdef USERPROG
    /* Owned by userprog/process.c. */
    uint32_t *pagedir;                   /* Page directory. */
#endif
    /* Owned by thread.c. */
    unsigned magic;  /* Detects stack overflow. */
  };
```





Pintos Thread System

- Read threads/thread.c and threads/synch.c to understand
  - How the switching between threads occur
  - How the provided scheduler works
  - How the various synchronizations primitives work

Task 1: Alarm Clock

- Reimplement timer_sleep( ) in devices/timer.c without busy waiting

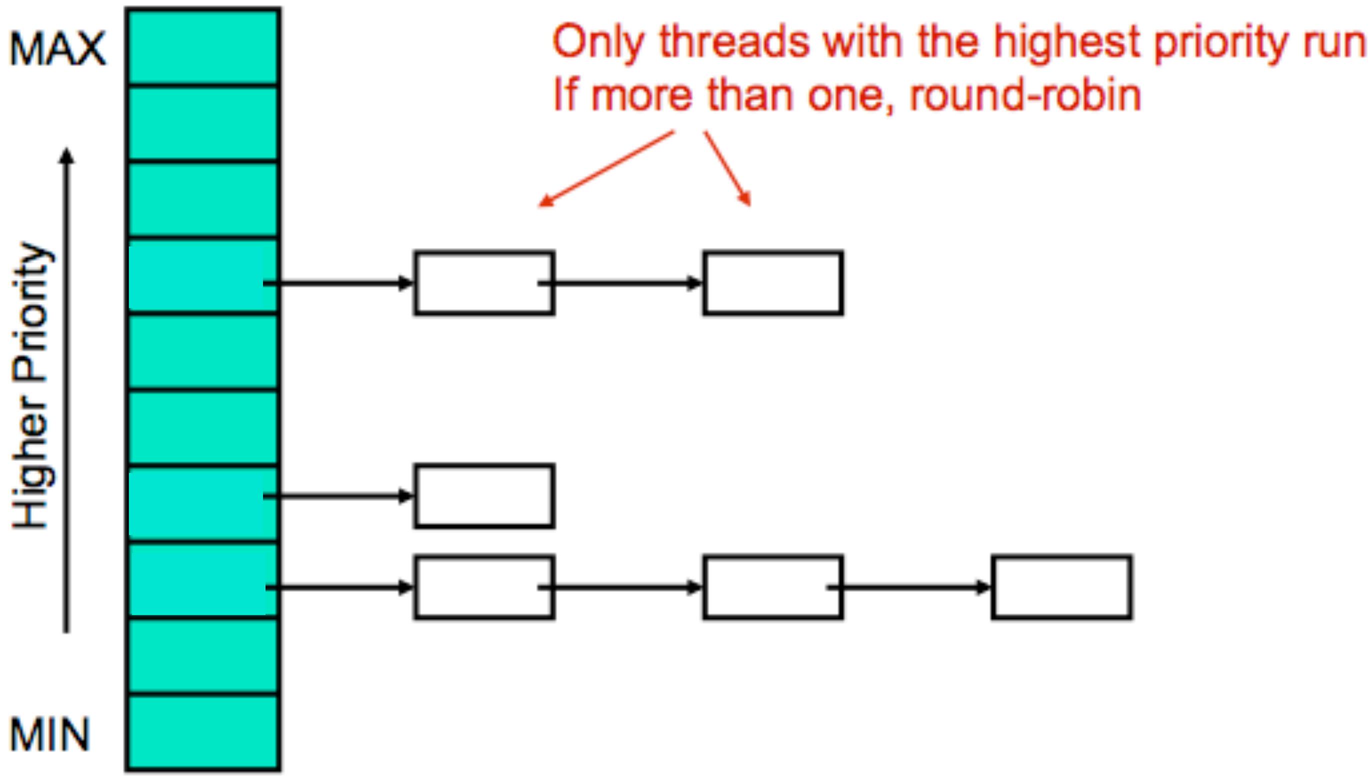
```
/* Suspends execution for approximately TICKS timer ticks. */
void timer_sleep (int64_t ticks){
 int64_t start = timer_ticks ();
 ASSERT (intr_get_level () == INTR_ON);
 while (timer_elapsed (start) < ticks)
  thread_yield ();
}
```

- Implementation details
  - Remove thread from ready list and put it back after sufficient ticks have elapsed

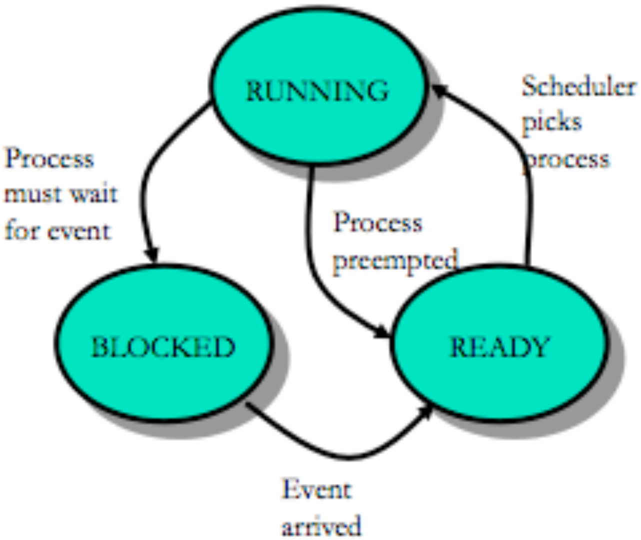
Task 2A: Priority Scheduler

- Ready thread with highest priority gets the processor
- When a thread is added to the ready list that has a higher priority than the currently running thread, immediately yield the processor to the new thread
- When threads are waiting for a lock, semaphore or a condition variable, the highest priority waiting thread should be woken up first
- Implementation details
  - compare priority of the thread being added to the ready list with that of the running thread
  - select next thread to run based on priorities
  - compare priorities of waiting threads when releasing locks, semaphores, condition variables

Priority Based Scheduling



thread_yield() to implement preemption



- Current thread ("RUNNING") is moved to READY state, added to READY list.
- Then scheduler is invoked. Picks a new READY thread from READY list.
- Case a): there's only 1 READY thread. Thread is rescheduled right away
- Case b): there are other READY thread(s)
  - b.1) another thread has higher priority – it is scheduled
  - b.2) another thread has same priority – it is scheduled provided the previously running thread was inserted in tail of ready list.
- "thread_yield()" is a call you can use whenever you identify a need to preempt current thread.
- Exception: inside an interrupt handler, use "intr_yield_on_return()" instead

Priority Inversion

- Strict priority scheduling can lead to a phenomenon called "priority inversion"
- Supplemental reading:
  - What really happened to the Pathfinder on Mars?
- Consider the following example where prio(H) > prio(M) > prio(L)

  H needs a lock currently held by L, so H blocks

  M that was already on the ready list gets the processor before L

  H indirectly waits for M

  - (on Path Finder, a watchdog timer noticed that H failed to run for some time, and continuously reset the system)

Task 2B: Priority Donation

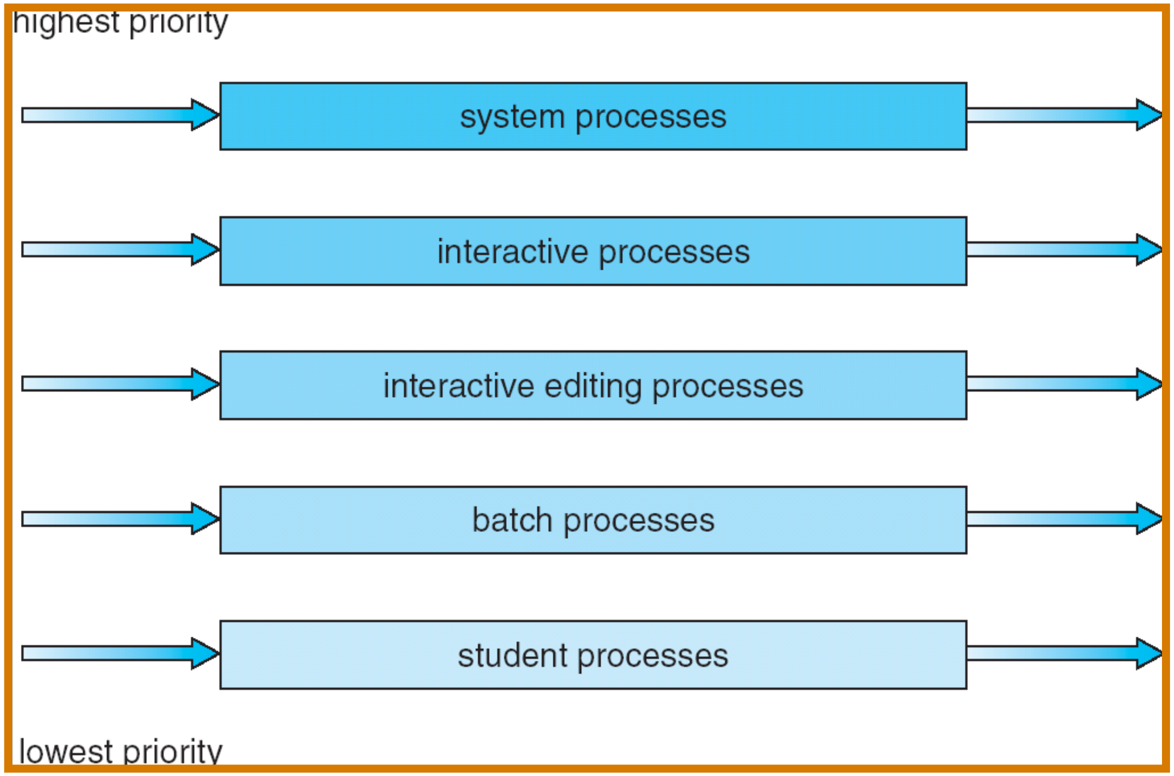
- When a high priority thread H waits on a lock held by a lower priority thread L, donate H's priority to L and recall the donation once L releases the lock
- Implement priority donation for locks

- Important:
  - Remember to return L to previous priority once it releases the lock.
  - Be sure to handle multiple donations (max of all donations)
  - Be sure to handle nested donations, e.g., H waits on M which waits on L...

Task 3: Advanced Scheduler

- Implement Multi Level Feedback Queue Scheduler
- Priority donation not needed in the advanced scheduler – two implementations are not required to coexist
  - Only one is active at a time
- Advanced Scheduler must be chosen only if '–mlfqs' kernel option is specified
- Read section on 4.4 BSD Scheduler in the Pintos manual for detailed information
- Some of the parameters are real numbers and calculations involving them have to be simulated using integers.
  - Write a fixed-point layer (header file)

Multilevel Queue Scheduling

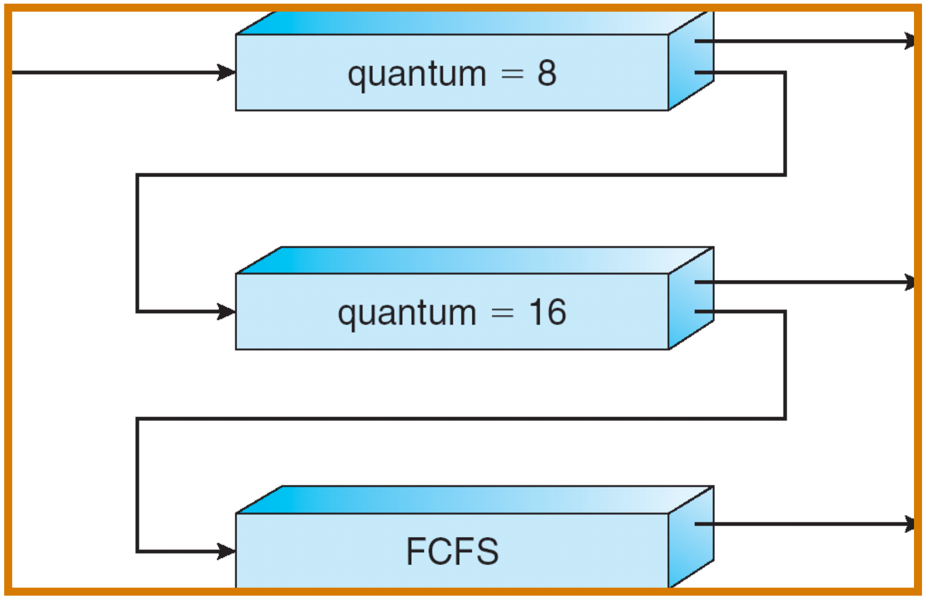


Multilevel Feedback Queue

- A process can move between the various queues; aging can be implemented this way
- Multilevel-feedback-queue scheduler defined by the following parameters:
  - number of queues
  - scheduling algorithms for each queue
  - method used to determine which queue a process will enter when that process needs service
  - method used to determine when to upgrade a process
  - method used to determine when to degrade a process

Example of Multilevel Feedback Queue

- Three queues:
  - Q_0 – RR with q = 8 ms
  - Q_1 – RR with q = 16 ms
  - Q_2 – FCFS



- Scheduling
  - A new job enters queue Q_0 which is served FCFS. When it gains CPU, job receives 8 milliseconds. If it does not finish in 8 milliseconds, job is moved to queue Q_1.
  - At Q_1 job is again served FCFS and receives 16 additional milliseconds. If it still does not complete, it is preempted and moved to queue Q_2.

Suggested Order of Implementation

- Alarm Clock
  - easier to implement compared to the other parts
  - other parts not dependent on this
- Priority Scheduler
  - needed for implementing Priority Donation and Advanced Scheduler
- Priority Donation | Advanced Scheduler
  - these two parts are independent of each other
  - can be implemented in any order but only after Priority Scheduler is ready

Debugging your Code

- printf, ASSERT, backtraces, gdb
- Running pintos under gdb
  - Invoke pintos with the gdb option

    pintos --gdb -- run testname
  - On another terminal invoke gdb

    pintos-gdb kernel.o
  - Issue the command

    debugpintos
  - All the usual gdb commands can be used: step, next, print, continue, break, clear etc
  - Use the pintos debugging macros described in manual

Step 4: Testing

Pintos provides a very systematic testing suite for your project:

1. Run all tests:

```
$ make check
```

2. Run individual tests:

```
$ make tests/threads/alarm-multiple.result
```

3. Run the grading script:

```
$ make grade
```

make check

- **pass** tests/threads/alarm-single
- **pass** tests/threads/alarm-multiple
- **pass** tests/threads/alarm-simultaneous
- FAIL tests/threads/alarm-priority
- **pass** tests/threads/alarm-zero
- **pass** tests/threads/alarm-negative

- FAIL tests/threads/priority-change
- FAIL tests/threads/priority-donate-one
- FAIL tests/threads/priority-donate-multiple
- FAIL tests/threads/priority-donate-multiple2
- FAIL tests/threads/priority-donate-nest
- FAIL tests/threads/priority-donate-sema
- FAIL tests/threads/priority-donate-lower
- FAIL tests/threads/priority-fifo
- FAIL tests/threads/priority-preempt
- FAIL tests/threads/priority-sema
- FAIL tests/threads/priority-condvar
- FAIL tests/threads/priority-donate-chain

- FAIL tests/threads/mlfqs-load-1
- FAIL tests/threads/mlfqs-load-60
- FAIL tests/threads/mlfqs-load-avg
- FAIL tests/threads/mlfqs-recent-1
- **pass** tests/threads/mlfqs-fair-2
- **pass** tests/threads/mlfqs-fair-20
- FAIL tests/threads/mlfqs-nice-2
- FAIL tests/threads/mlfqs-nice-10
- FAIL tests/threads/mlfqs-block

Grading

TOTAL 110 points: 93 points for the implementation + 17 points for the documentation:

- **18 points:** A completely working Alarm Clock implementation that passes all six (6) tests.
- **38 points:** A fully functional Priority Scheduler that passes all twelve (12) tests.
- **37 points:** A working advanced scheduler that passes all nine (9) tests.
- **12 points:** A complete design document.
- **5 points:** A well-documented and clean source code.

make grade (1)

```
SUMMARY OF INDIVIDUAL TESTS

Functionality and robustness of alarm clock (tests/threads/Rubric.alarm):
             4/ 4 tests/threads/alarm-single
             4/ 4 tests/threads/alarm-multiple
             4/ 4 tests/threads/alarm-simultaneous
             4/ 4 tests/threads/alarm-priority

             1/ 1 tests/threads/alarm-zero
             1/ 1 tests/threads/alarm-negative

        - Section summary.
              6/  6 tests passed
             18/ 18 points subtotal

Functionality of priority scheduler (tests/threads/Rubric.priority):
             3/ 3 tests/threads/priority-change
             3/ 3 tests/threads/priority-preempt

             3/ 3 tests/threads/priority-fifo
             3/ 3 tests/threads/priority-sema
             3/ 3 tests/threads/priority-condvar
```

```

Pintos include fully automated grading scripts, students see score before submission

Step 5: Design Document

Use the template in Section 2.2.1 of the Pintos documentation.

```
                          ALARM CLOCK
                          ===========

---- DATA STRUCTURES ----

>> A1: Copy here the declaration of each new or changed `struct' or
>> `struct' member, global or static variable, `typedef', or
>> enumeration.  Identify the purpose of each in 25 words or less.

---- ALGORITHMS ----

>> A2: Briefly describe what happens in a call to timer_sleep(),
>> including the effects of the timer interrupt handler.

>> A3: What steps are taken to minimize the amount of time spent in
>> the timer interrupt handler?

---- SYNCHRONIZATION ----

>> A4: How are race conditions avoided when multiple threads call
>> timer_sleep() simultaneously?

>> A5: How are race conditions avoided when a timer interrupt occurs
>> during a call to timer_sleep()?

---- RATIONALE ----

>> A6: Why did you choose this design?  In what ways is it superior to
>> another design you considered?
```

Submission

1. All source code (the full source tree)

2. README file

3. Design document

- Everything due by October 22nd @11:59PM
